INFILTRATION

Infiltration is the downward entry of water into the soil. The velocity at which water enters the soil is infiltration rate. Infiltration rate is typically expressed in inches per hour. Water from rainfall or irrigation must first enter the soil for it to be of value.

Infiltration measurement

A one inch layer of water is added to a six inch diameter ring to measure infiltration rate.

Infiltration rate measurement

Factors affecting infiltration rate

- Inherent
- Dynamic

Soil type	Basic infiltration rate (mm/hour)
sand	less than 30
sandy loam	20 - 30
loam	10 - 20
clay loam	5 - 10
clay	1 - 5

POROSITY

Sand, Silt, and Clay
