

Scenario: “EduConnect” — An Educational Networking Platform

A group of innovative graduates is planning to launch a new educational networking platform called **EduConnect**. They want to create a space where students, teachers, and professionals can connect, share academic posts, and collaborate on learning resources.

They have approached you to help design their **database** for the application using an **Entity Relationship Diagram (ERD)** model. The requirements are as follows:

System Requirements

1. Users and Profiles

- Every person using EduConnect is considered a *User*.
- Each user has a profile with **UserID**, **Name**, **Email**, **City**, and **Country**.
- A user can specify their **Role** — either *Student*, *Teacher*, or *Professional*.

2. Institutions

- A user can be affiliated with an **Institution** (e.g., a university, school, or organization).
- Each institution has an **InstitutionID**, **Name**, **Type** (e.g., University, School, Company), and **Location**.
- If the institution doesn’t exist in the system, the user can **create** it.

3. Connections

- Users can “**Follow**” other users.
- The follow relationship is **one-way** (not necessarily mutual).
- A user can follow **up to 300 people**.

4. Posts

- Users can create posts to share knowledge.
- There are two types of posts: **Article** and **Media**.
- Each post has a **PostID**, **PostType**, **Content**, **DatePosted**, and belongs to **one user**.
- A user can make **up to 8 posts per day**.

5. Reactions

- Other users can react to posts by **Upvoting** or **Downvoting**.
- Each user can react to **up to 50 posts per day**.
- Posts with a higher number of downvotes may be hidden after a few days.

6. Reports

- Users can report posts they find inappropriate.
 - A report includes **ReportID**, **ReportDate**, and a **Reason** (e.g., Plagiarism, Spam, Inappropriate Language).
 - Each report is linked to the **User who reported**, and the **Post being reported**.
-

Your Task

Design an **Entity Relationship Diagram (ERD)** for the above scenario.
Clearly identify:

- Entities and attributes
- Primary keys and foreign keys
- Relationships (including cardinalities and participation)
- Any **constraints** or **assumptions** (e.g., maximum posts, one-way following, etc.)
- Mention if any relationships have **descriptive attributes**
